Abstract:

"Building Information Management" being a trend in these years. With the use of this system, information is being shared through each stage of project cycle and managing in an integrated way. Communication among different stakeholders is improved, working efficiency is increased.

However, results showing a small percent of BIM system implement in existing buildings (eBIM) because of labour and time intensive on converting captured data into BIM Model. "Sharp tools make good work" applying laser scanning technology can solve this problem.

Laser Scanning is a non-contact measuring technique to capture a dense, accurate digital information of objects in a rapid way. All the information is capture in a faster way, model can be created with the help of different 3D modelling software. This grows the interest in "Scan to BIM".

Several case studies with live demonstration of how the laser scanner work will be perform."
